Does the checklist before a break tell when the break is sound?

The coaching method's five questions read as board code, on the 1,269 breaks of his quiet positions and 1,417 of strong players', refereed by Stockfish

Chess Coach research lab

Abstract

A break the app teaches for his pawn structure, played merely because it can be, is sound about one time in five, so what the app can teach is the moment. The coaching method the app follows names the moment with five questions to ask before a break: are the pieces developed and aimed at the lines it opens, are the rooks ready for the new file, does it create a passed pawn or expose a king, is the force on that side equal or better, has it been calculated? Read with the app's own board readings on the breaks of his quiet positions, all five pass for eight of his 1,269 breaks, so the rule tests the three questions about the pieces, among the breaks the app's blunder check calls safe, comparing each break with the same break of the same structure at other moments. By the rule fixed before any reading was joined to a score, there is no signal: the lift is 3.0 and 2.3 points on the two halves of his games, with both intervals across 0, and −7.0 for strong players. The controls pass, and the blunder check itself tells the moment: a safe break is sound about twice as often as one that is not (26.0% and 31.4% against 13.7% and 12.9%). Even where a safe break has its pieces ready, it is sound 26.1% and 33.3% of the time, against his own move's 54.3% and 57.7%. The app can keep the checklist as a way of thinking and put the blunder check first, but the verdict on a break in a position stays the engine's.

1 The question

The study of the breaks the app teaches for each pawn structure found that a break played merely because it can be is sound about one time in five in his quiet positions, no more often than a random move, while his own move is sound more than half the time; the breaks he chose were as sound as his other moves. What the app can teach is the moment. The coaching method the app follows names the moment with a checklist to run before playing a break: pieces developed and pointed at the lines that open, rooks ready for the new file, a passed pawn or an exposed king, equal or better force on that sector, three or four moves calculated. It adds that rushing the break before the pieces are ready is the most common structural error at his level.

Read as board code, does that checklist tell a sound break from an unsound one? If it does, the review and the drills can teach the moment in the checklist's words: the pieces are not ready yet, so the break opens lines for the other side. If it does not, the checklist read this way cannot stand in for the engine's word on a position, and the app should not offer it as the test of when to break.

2 How it was measured

The breaks. Every break of every position the structure study scored: his quiet middlegame and endgame positions with a break on, from his 10-minute games in the app's archive at commit

`f4bd63f19b`, in two halves by the games' end time (491 positions in 114 games, and 418 in 103), and 1,200 positions of strong players, one a game, from the Lichess games of September 2026 between two players rated 2200 or more. Nothing is fitted, so the halves are two replications. A break is a legal pawn move that the app's `playedLever` counts as a break of the structure the app names on the board, for the side to move. Each break is a unit: his 716 and 553 breaks and the strong players' 1,417. Its soundness is the structure study's: Stockfish at the app's grading budget of 250,000 nodes, the hash cleared before each position, accepts it when it gives up no more than 3 win% against the best. Its group is its structure and the break it plays, such as the London pyramid's c3-c4.

The questions, as board code. Each question reads the position before the break, through the app's knowledge service. The break moves a pawn to the break square; its targets are the other side's pawns the pawn attacks from there; the lines it opens are the files of the pawn's square, the break square and the targets; its sector is the break square's file and the files on either side.

1. **Pieces aimed**: no knight or bishop on its starting square, and at least two of the mover's knights, bishops, rooks and queens aimed at the break: a rook or queen on one of the lines it opens, or a piece that sees the break square or a target.
2. **Rooks ready**: a rook on one of those lines, or with a legal move to one; a mover with no rook passes.
3. **A passer or an exposed king**: a new passed pawn for the mover, or a thinner shelter in front of the other king by the app's shelter scale, after the break or after the trade it offers (the break's pawn and a target off the board).
4. **Force on that side**: the mover's knights, bishops, rooks and queens on the sector's files are worth at least the other side's, by the app's piece values.
5. **Safe**: the app's blunder check calls the break safe: it allows no mate in one, leaves nothing newly hanging and deserts no defence. That is as much of three or four moves calculated as board code reads without an engine.

A break whose pieces are ready passes questions 1, 2 and 4; a safe break whose pieces are not ready is rushed.

The lift. The lift of a reading is the share of sound breaks among those it passes minus the share among those it fails, within each group, pooled over the groups with breaks on both sides by the weight $n_1 n_0/(n_1 + n_0)$. It compares each break with itself at other moments, so it measures the moment, not which break is the sounder in general. Intervals come from 2,000 bootstrap draws with seed 20261020, resampling his games within a half, or the strong players' positions: the 95% percentile interval.

3 Counted before the rule

Before the rule was fixed, each question was read on every break and the passes counted, with no score of any move read (Table 1). All five pass for eight of his 1,269 breaks and eleven of the strong players' 1,417: the question of a passer or an exposed king passes for 7% of his breaks, and the checklist taken whole cannot be tested. The rule tests the three piece questions, the ones the checklist calls the common error, among the breaks the blunder check calls safe: 157 of 446 and 136 of 344 of his safe breaks have their pieces ready.

	His, first half	His, second half	Strong players
Breaks (positions)	716 (491)	553 (418)	1,417 (1,200)
1. Pieces aimed	359 (50.1%)	294 (53.2%)	507 (35.8%)
2. Rooks ready	567 (79.2%)	474 (85.7%)	1,171 (82.6%)
3. A passer or an exposed king	50 (7.0%)	42 (7.6%)	165 (11.6%)
4. Force on that side	369 (51.5%)	335 (60.6%)	787 (55.5%)
5. The blunder check: safe	446 (62.3%)	344 (62.2%)	758 (53.5%)
All five	4 (0.6%)	4 (0.7%)	11 (0.8%)
Safe, with the pieces ready	157 of 446	136 of 344	145 of 758

Table 1: Counted before the rule was fixed, from the board alone, with no score read: the breaks each question passes, all five, and the safe breaks with the pieces ready (questions 1, 2 and 4), among the safe breaks.

4 The rule, fixed before any reading was joined to a score

The controls come first, and if any fails there is no verdict. (1) The move played must be sound more often than a random move that is not a break, by an interval above 0, on each half and for the strong players. (2) A reading known to matter must show: the blunder check's own lift, over all breaks, above 0 on both halves; without it, a lift the piece questions lack could be one this design cannot see. (3) A reading drawn at random, passing as many safe breaks in each group as the pieces' readiness does, must reach neither verdict below.

Then, on his safe breaks: the pieces tell the moment when the lift of their readiness lies above 0 on both halves; they mislead when it lies below 0 on both; otherwise there is no signal; and there is not enough data when a half has fewer than 60 safe breaks with the pieces ready or fewer than 60 rushed ones.

5 The verdict: no signal

The controls pass (Table 2). His move is sound 36.3 and 37.6 points more often than a random move, and the strong players' 51.8. The blunder check tells the moment: 12.5 points (2.5 to 22.1) and 15.9 (6.1 to 26.0), and 20.8 for the strong players. The random reading's lift is −10.7 (−18.2 to −2.5) and 9.1 (0.2 to 18.9): its intervals leave out 0 on both halves, but on opposite sides, so it reaches neither verdict and the control passes by the rule. Section 8 checks those intervals on many random readings.

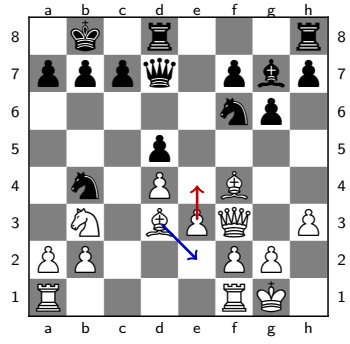

The pieces' readiness gives no signal: its lift is 3.0 points (−5.7 to 11.2) and 2.3 (−6.0 to 11.8). The safe breaks with the pieces ready are sound 26.1% and 33.8% of the time, the rushed ones 26.0% and 29.8%. In the strong players' positions, reported and not ruled on, the lift is −7.0 (−15.8 to 1.6).

	His, first half	His, second half	Strong players
1. The move played minus a random move	36.3 (30.8, 41.5)	37.6 (31.7, 43.5)	51.8 (48.7, 54.8)
2. The blunder check's lift	12.5 (2.5, 22.1)	15.9 (6.1, 26.0)	20.8 (16.4, 25.1)
3. A random reading's lift	−10.7 (−18.2, −2.5)	9.1 (0.2, 18.9)	–
Pieces ready, the lift	3.0 (−5.7, 11.2)	2.3 (−6.0, 11.8)	−7.0 (−15.8, 1.6)
Safe breaks: ready / rushed	157 / 289	136 / 208	145 / 613
Sound: ready / rushed (%)	26.1 / 26.0	33.8 / 29.8	29.0 / 33.3
Sound: safe / not safe (%)	26.0 / 13.7	31.4 / 12.9	32.5 / 12.3

Table 2: The controls and the rule's lift, in points, with 95% intervals resampling his games, or the strong players' positions. The strong players' column is reported, not ruled on. Below, the share of breaks that are sound on each side, in %, before the groups are weighed.

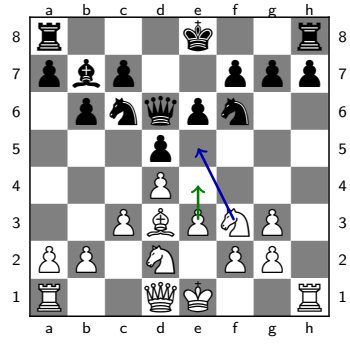

6 Two positions

Two of his positions show the checklist and the engine disagreeing (Figure 1): the first of the later half where a safe break with its pieces ready is unsound while his own move is sound, and the first where a rushed safe break is sound while he played something else. They illustrate; they test nothing.

FEN `1k1r3r/pppq1pbp/5np1/3p4/1n1P1B2/1N1BPQ1P/PP3PP1/R4RK1 w - - 2 14`

(a) He is White, in the middlegame, in the Carlsbad. The break 14. e4 opens the d-file and e-file. Aimed at it: ♗d3 and ♕f3 (yes); rooks ready: ♖a1 and ♖f1 (yes); force 20 against 17 (yes); safe. Stockfish: 14. ♗e2 is best at 69% to win; the break is not sound (36%). He played 14. ♗e2 (blue), sound at 68%.

FEN `r3k2r/pbp2ppp/1pnqpn2/3p4/3P4/2PBPNP1/PP1N1PP1/R2QK2R w KQkq - 2 10`

(b) He is White, in the middlegame, in the London pyramid. The break 10. e4 opens the d-file and e-file. Aimed at it: ♗d3, ♘d2 and ♕d1 (yes); rooks ready: none (no); force 18 against 12 (yes); safe. Stockfish: 10. ♕a4 is best at 55% to win; the break is sound (55%). He played 10. ♘e5 (blue), not sound at 38%.

Figure 1: Two of his positions with a safe break. The break is green where Stockfish finds it sound and red where it does not; win% is his after each move. Stockfish at 250,000 nodes, rerun for this figure.

7 What the breaks describe

Each question alone. Over all the breaks, safe or not, the blunder check has the largest lift, 14.2 points with his halves together (Table 3), and for the strong players it is the only question whose interval lies above 0. For him, the pieces aimed (6.8 points) and the force on that side (9.2) also lie above 0 over all breaks, safe or not; the rooks ready and the question of a passer or an exposed king do not.

Question	His breaks: pass / fail	His, halves together	His, first half	His, second half	Strong players
Pieces aimed	653 / 616	6.8 (1.7, 12.6)	8.9 (2.4, 15.9)	4.0 (−3.9, 13.2)	−0.8 (−5.4, 3.7)
Rooks ready	1,041 / 228	3.6 (−3.5, 9.8)	4.8 (−4.7, 12.6)	1.0 (−9.5, 10.8)	0.5 (−5.4, 6.3)
A passer or an exposed king	92 / 1,177	9.1 (−7.3, 27.1)	24.0 (4.4, 52.1)	−4.7 (−25.8, 22.6)	1.5 (−6.7, 9.6)
Force on that side	704 / 565	9.2 (3.5, 14.4)	8.2 (1.5, 15.3)	9.2 (0.3, 18.2)	1.8 (−2.3, 6.1)
The blunder check: safe	790 / 479	14.2 (7.7, 20.4)	12.5 (3.0, 22.2)	15.9 (6.4, 26.0)	20.8 (16.3, 25.2)
The four but purpose, together	293 / 976	9.4 (3.9, 15.1)	7.3 (−0.1, 15.0)	10.4 (2.5, 18.2)	6.1 (−1.6, 14.1)

Table 3: Each question alone over all the breaks, safe or not, and the four questions other than purpose together: the lift, in points, with 95% intervals.

The more questions pass. Over all his breaks, the share sound rises with the number of questions passed: 14.3% with one, 18.0% with two, 25.9% with three and 32.1% with four (Table 4). That count mixes the groups and the blunder check, and four questions passing still leave the break sound less often than his own move.

All his breaks, by questions passed			The safe breaks, by piece questions passed				
Of five	Breaks	Sound (%)	Of three	His breaks	His, sound (%)	Strong breaks	Strong, sound (%)
0	45	0.0 (0.0, 0.0)	0	37	13.5 (3.4, 23.1)	57	26.3 (15.8, 37.9)
1	189	14.3 (8.6, 20.8)	1	185	20.5 (14.3, 27.4)	205	34.1 (27.5, 40.6)
2	345	18.0 (14.0, 22.6)	2	275	34.2 (27.4, 41.3)	351	33.9 (29.2, 39.0)
3	367	25.9 (20.7, 31.0)	3	293	29.7 (23.8, 35.8)	145	29.0 (21.8, 36.3)
4	315	32.1 (25.9, 38.0)					
5	8	*n=8*					

Table 4: The share of breaks that are sound, in %, with 95% intervals. Left: all his breaks, both halves together, by how many of the five questions they pass (fewer than 30 breaks shows only their number). Right, added after the run: the safe breaks, his and the strong players', by how many of the three piece questions they pass.

By group. In each of the three groups with enough safe breaks on both sides, the London pyramid's two breaks and the advance chain's . . . f7-f6, the lift holds 0 (Table 5); the other 19 groups have too few breaks on one side.

His choice, and the ready break against his move. He played a safe break with the pieces ready 7.2% of the time, a rushed one 8.7% and an unsafe one 3.1% (Table 6). Within the groups,

Break	Ready / rushed	Ready, sound (%)	Rushed, sound (%)	Lift (points)
London pyramid, c3-c4	113 / 183	30.1 (21.2, 38.9)	28.4 (20.7, 37.1)	1.7 (−8.3, 10.8)
London pyramid, e3-e4	93 / 107	38.7 (28.0, 50.0)	30.8 (21.2, 41.6)	7.9 (−6.9, 21.5)
Advance chain, . . . f7-f6	37 / 67	13.5 (3.0, 29.4)	9.0 (2.1, 18.6)	4.6 (−6.6, 19.5)

Table 5: His safe breaks, both halves together, for each group with at least 30 breaks with the pieces ready and 30 rushed: the share sound on each side and the difference, with 95% intervals.

the share of ready breaks he played minus the share of rushed ones is −1.0 points (−4.6 to 2.9): he does not wait for the pieces, but he does avoid the unsafe breaks, as the strong players do. Where a safe break has its pieces ready, in 138 and 111 of his positions, those breaks are sound 26.1% and 33.3% of the time and his own moves there 54.3% and 57.7%: the ready break trails his move by −28.3 points (−37.7 to −18.6) and −24.3 (−32.6 to −16.2).

	Safe, pieces ready	Safe, rushed	Not safe
He played the break (%)	7.2	8.7	3.1
Strong players played it (%)	16.6	14.0	4.2
	Positions	The ready breaks, sound	His move, sound
His, first half	138	26.1 (18.1, 34.3)	54.3 (45.8, 62.6)
His, second half	111	33.3 (25.2, 42.3)	57.7 (49.5, 67.0)

Table 6: Above: how often the break was the move played, by what the questions say of it. Below: his positions with a safe break whose pieces are ready, the share of those breaks that are sound and of his moves there, in %, with 95% intervals.

8 Added after the run

The intervals. The random reading's intervals left out 0 on both halves, which a 95% interval should do for about one random reading in twenty on each. Over 1,000 random readings drawn the same way, the lift spreads by 4.4 and 5.2 points, and the bootstrap's own spread for 100 of them is 4.3 and 5.2; their intervals leave out 0 for three and six of the 100. The intervals hold their width; the reading the rule drew lies 2.4 and 1.7 spreads from 0, an unlucky draw. The pieces' readiness lies no farther from 0 than random readings often do: 0.54 and 0.68 of them lie as far (Table 7).

Each piece question alone, among the safe breaks. With his halves together, the pieces aimed give 7.4 points (1.1 to 14.8) and the force on that side 8.4 (0.6 to 15.8), while the rooks give −0.9 (−11.0 to 8.4); for the strong players none lies above 0 (−6.0, −1.4 and 3.2). Asking for all three loses what the aimed pieces and the force carry: his safe breaks passing two of the piece questions are sound 34.2% of the time and those passing all three 29.7% (Table 4). These readings were chosen after the run, among several, so they do not overturn the verdict; a rule built on the aimed pieces or the force needs positions this study did not see.

Question	His safe breaks: pass / fail	His, halves together	His, first half	His, second half	Strong players
Pieces aimed	465 / 325	7.4 (1.1, 14.8)	9.9 (1.6, 18.3)	4.0 (−6.3, 17.7)	−6.0 (−13.5, 1.2)
Rooks ready	674 / 116	−0.9 (−11.0, 8.4)	−3.6 (−17.8, 7.9)	1.2 (−11.7, 16.2)	−1.4 (−9.8, 6.9)
Force on that side	475 / 315	8.4 (0.6, 15.8)	8.9 (−1.2, 17.8)	5.5 (−7.1, 17.8)	3.2 (−3.9, 10.2)

The intervals, checked on random readings drawn as the null draws its own

	Spread of random lifts	The bootstrap's spread	Intervals leaving out 0	Pieces ready's lift	Random lifts as far from 0
His, first half	4.4	4.3	3 of 100	3.0	0.54
His, second half	5.2	5.2	6 of 100	2.3	0.68

Table 7: Added after the run. Above: each piece question alone among the safe breaks, the lift in points with 95% intervals. Below: the spread of the lift, in points, over 1,000 random readings that pass as many safe breaks in each group as pieces ready does, the bootstrap's spread for 100 of them, how many of those 100 intervals leave out 0, and the share of random readings whose lift is at least as far from 0 as pieces ready's.

9 What the app can take

- **The blunder check first.** Of the checklist's questions, the one that tells the moment is the calculation, as the app's blunder check reads it: a safe break is sound about twice as often as one that is not, for him and for strong players. When the review, a drill or the coach's reading of a position names a break, the first thing it checks is that the break leaves nothing loose.
- **Not the piece questions as the verdict.** With the break safe, whether the pieces are aimed, the rooks ready and the force there tells nothing about whether the break is sound, for him or for strong players. The app should not call a break ready or rushed by these readings as a judgment of the move. The questions can stay as a way of thinking about a structure; the verdict on a break in a position is Stockfish's.
- **A ready break is still no suggestion.** Where a safe break has its pieces ready, it is sound about three times in ten, his own move more than five times in ten. The app should never offer a break as the move on the checklist's word.

10 Caveats

- **A reading of the words.** "Pointed at the lines that open", "ready" and "sector" are read here one way each, fixed before any score was joined; a coach might read them otherwise, which would be another study.
- **The checklist taken whole.** All five questions almost never pass, so only the piece questions and each question apart were tested.
- **The breaks are the app's.** Only the breaks the structure catalogue names are tested, at the squares the app reads.
- **Sound is a window.** Several moves are often within 3 win% of the best; a break that is not the best can be sound.
- **Many breaks a game for him.** A game where a break stays on counts many times; intervals resample whole games for that reason.
- **The same positions.** The positions, scores and referee are the structure study's; only the two positions shown were searched again.

- **Added after the run.** The check of the intervals and the piece questions alone among the safe breaks were chosen once the rule had been applied. They describe and decide nothing.
