Where do his choices differ from players 200 points above him?

Twenty-two kinds of move in his 10-minute games, against Maia-2 at the band above, corrected on Lichess and priced by Stockfish

Chess Coach research lab

Abstract

Which kinds of move does he play more often, or less often, than players 200 points above him would in his own positions, and which of those differences cost him? Over 9,052 of his moves in 647 10-minute games, Maia-2 at the band above, corrected for its bias on 23,832 positions of Lichess players, gives the expected count of each of 22 kinds of move, and Stockfish prices each difference. By the rule fixed before any position was scored, the study gives no verdict, because its known-fault control failed. He leaves a piece hanging no more often than the band above would (R 0.90 and 0.93 on the two halves, both intervals holding 1), and less often than players at his own rating would (0.77 and 0.67, both intervals below 1). When he does leave one and the band above would not, it costs him 13.8 and 14.1 win% more than his other differences. The null control passed. Without a verdict, four differences show on both halves: he plays pawn breaks about half again as often as the band above (R 1.60 and 1.51), retreats less often (0.86 and 0.88), and gives check (1.18 and 1.12) and doubles or isolates his own pawns (1.13 and 1.28) more often. None of the four costs him more than his other differences. Added after the run: among Lichess players, retreats rise and checks fall with rating while pawn breaks show no trend, so his pawn breaks look like his own way of playing, and his fewer retreats and extra checks like the level he is climbing from.

1 The question

A coach who has watched a player for a while can say what he does differently from stronger players: he trades too readily, he rarely retreats, he pushes the pawns in front of his own king. That kind of remark changes how a player plays, and it is not an engine's top move. This study asks it of his games with the app's own instruments. Which kinds of move does he play more often, or less often, than players 200 points above him would in the same positions, and which of those differences cost him? A difference that shows in both halves of his games and costs him more than his other differences is a habit worth coaching. One that shows but costs no more is his style, worth knowing but not worth changing, and one that shows in only one half is not a habit.

The comparison needs a stand-in for the stronger players in his own positions. Maia-2, the app's model of human moves, was trained on Lichess games to predict the move a player at a rating band makes. At the band above his it gives each legal move a probability, so it says how often players 200 points above him would play each kind of move in exactly his positions. A model's probabilities are not players' choices, so the study first measures, on Lichess games at those bands, how often players play each kind against how often Maia-2 predicts, and corrects for the difference. Stockfish then prices each difference.

2 How it was measured

His positions. His 647 10-minute games in the app's archive at commit `f4bd63f19b`, in order of their end time: the first 324 (July 22 to August 23) and the last 323 (August 23 to October 15) are the two halves. Each of his moves enters when the position is past the opening by the app's divider, he is not in check and has at least two legal moves, his win% before the move is between 10 and 90 by the archive's evaluation (the game is still open), and his clock shows at least 30 seconds. That leaves 9,052 positions from 601 games, 4,600 in the first half and 4,452 in the second. Most of the rest are opening moves (6,974), moves in check (1,614) or moves in decided games (2,518).

The bands. Maia-2, the app's model of human moves, gives every legal move a probability at a rating band, conditioned on the opponent's band. His band is his rating at the game with the app's offset of 250 points to Lichess, and the band above is his rating plus 200, the same way. His band was 1000 to 1300 in the first half and 1100 to 1400 in the second, and the band above 1100 to 1500 and 1300 to 1600. Maia-2's lowest band holds every rating below 1100, so in 62 of his earliest games the band above is one band up rather than two.

The kinds of move. Every legal move in every position is read by the app's code (Table 1). Of the 22 kinds, ten come from the move itself, eleven from the insights the app reads for a move as the board shows it, and one, a move that leaves a piece standing to be taken, is the control. A move can be of several kinds. A pawn left to be taken does not count as hanging, and a capture of a knight or more that nothing takes back counts as a tactic even when it recaptures in a trade.

The rate. For a kind and a half, N is the number of his moves of that kind. Maia-2's expected count sums, over his positions, the probability it gives at the band above to the moves of that kind. Maia-2 is a model, so it may predict a kind more or less often than players at its band play it. To correct for that, September 2026's Lichess games at 10 minutes give the first 2,000 player-games at each band from 1000 to 1600 (the lowest band counted from 900), and up to two positions from each, drawn among those that pass his filters, the win% filter by Stockfish at 120,000 nodes, with at most six tried: 23,832 positions from 12,256 player-games. At each band, κ is the number of moves of the kind those players played over the number Maia-2 at that band expected. His expected count E multiplies each position's predicted share by κ at that position's band above, and $R = N/E$ is how often he plays the kind relative to players 200 points above him, in his positions.

The cost. T is the move Maia-2 at the band above rates most likely and P his move. Stockfish through the app's engine service, at 250,000 nodes with its hash cleared and no tablebase, scores each, and D is his win% after T minus after P (zero where they are the same move). For a kind he plays too often, the instances are the positions where P is of that kind and T is not; for one he plays too rarely, where T is and P is not. The relative cost is the mean D over the instances minus the mean D over his other differences, the positions where P is not T and neither is of the kind.

Intervals. 2,000 bootstrap draws resample his games within each half and the Lichess player-games within each band; intervals are the 95% percentile intervals.

Kind	The move
Capture	captures
Check	gives check
Pawn push	moves a pawn without capturing
Retreat	steps a knight, bishop, rook or queen back toward its own side, without capturing
King move	moves the king, castling aside
Queen move	moves the queen
Even trade	captures a piece in an exchange the app scores level
Worst piece moves	moves the piece the app names his worst
Thins his shelter	thins his own king's pawn shelter
New threat	leaves him a new capture that wins material, or a new mate in one
Open file	puts a rook or queen on an open or half-open file
Battery	lines up two pieces on a line
King pressure	attacks more of the squares around the enemy king, at least three
Pawn break	strikes at an enemy pawn chain or centre pawn with a pawn
Passed pawn	leaves the moved pawn passed, or promotes it
Outpost	settles a knight or bishop on a pawn-guarded square no enemy pawn can attack
Seventh rank	lands a rook on the seventh rank against pawns or the king
Active king	brings the king forward in an endgame
Gives the bishop pair	takes a knight with a bishop and gives up the pair
Weakens his pawns	doubles or isolates his own pawns
Tactic	forks, pins, skewers, traps a piece or takes one that nothing takes back
Hangs a piece	leaves a knight, bishop, rook or queen of his standing to be taken, without capturing

Table 1: The 22 kinds of move. The first ten are read from the move itself, the next eleven from the insights the app reads for a move, and the last is the control, a known fault at his level.

The rule, fixed before any position was scored. Two controls come first, and if either fails on either half the study gives no verdict. The known fault: a move that leaves a piece standing to be taken must be over-used on both halves, and cost more than his other differences on both. The null: a player who plays a move drawn from Maia-2's own policy at the band above, compared with Maia-2's expected count without κ, must show no kind over- or under-used. Then a kind is *over-used* when R's interval lies above 1 on both halves and *under-used* when it lies below 1 on both. In that direction it *costs* when the relative cost's interval lies above 0 on both halves and is *cheap* when it lies below 0 on both. The verdict is a *costly habit*, a *habit that costs no more*, a *cheap habit*, or *no habit*. A kind is *not enough data* when E is under 30 in either half, or, for the cost, when it has fewer than 30 instances in either half, and *not measurable* when the correction averaged over a half's positions lies outside 2/3 to 3/2.

3 The controls

The known fault fails. He leaves a piece hanging, by the app's reading, in 2.4% of his positions in the first half and 1.8% in the second: 111 and 82 moves. Against the band above, R is 0.90 (0.73 to 1.09) and 0.93 (0.70 to 1.20). Both intervals hold 1, so the control fails on both halves, and by the rule the study gives no verdict on any kind. The cost half of the control holds: where he leaves a piece hanging and the band above's most likely move does not, his move gives up 16.9 and 16.9 win% on average, 13.8 (9.3 to 18.6) and 14.1 (9.1 to 19.4) more than his other differences.

Why it fails. The control assumed he leaves pieces hanging more often than stronger players, and he does not. Against Maia-2 at his own band, corrected the same way, R is 0.77 (0.63 to 0.93) and 0.67 (0.52 to 0.86), both below 1: he leaves a piece hanging less often than players at his rating would in his positions. The reading itself follows rating. Added after the run, Lichess players leave a piece hanging in 3.9% of their positions at 1000 and 1.9% at 1600 (Table 7). The control also asked for more than this sample can show. In his positions the expected count at his band is 1.17 times the band above's in the first half and 1.37 times in the second, while R's interval spans about ±19% and ±27% of R. A player who left pieces hanging exactly as often as players at his band would have shown R near 1.17 in the first half, and an interval as wide as his around it would still hold 1.

The null passes. A player who plays a move drawn from Maia-2's policy at the band above in each of his positions shows no kind over- or under-used on both halves. On single halves, three of the 44 intervals miss 1, about what chance gives at 95%.

4 What the positions describe

With no verdict, this section describes; nothing in it is a habit by the rule.

Four differences on both halves. Four kinds lie on one side of 1 on both halves (Table 2). He plays pawn breaks about half again as often as the band above: R is 1.60 (1.30 to 1.97) and 1.51 (1.21 to 1.94). He retreats less often (0.86 and 0.88), and he gives check (1.18 and 1.12) and doubles or isolates his own pawns (1.13 and 1.28) more often. None of the four costs him more than his other differences: each relative cost's interval holds 0 on both halves. On average his extra checks give up 1.6 and 1.5 win% against the band above's move, against 3.5 and 3.2 for his other differences, though the interval of the difference holds 0. Captures, pawn pushes, even trades and tactics, four more kinds, differ on one half only.

His level or his own. Against Maia-2 at his own band (Table 3), pawn breaks (1.38 and 1.45), his own pawn weaknesses (1.18 and 1.25) and even trades (1.16 and 1.13) are more frequent on both halves, so they set him apart from players at his rating as well. Retreats and checks do not: against his own band each is within the noise on one half. Even trades stand out against the band above only in the second half, where R is 1.18 (1.05 to 1.32).

By phase. His fewer retreats are a middlegame difference: R is 0.83 (0.78 to 0.89) in the middlegame and 0.94 (0.87 to 1.02) in the endgame. He also moves his king less often in the middlegame, castling aside, at 0.70 (0.55 to 0.86). His pawn breaks stand out in both phases, at 1.56 and 1.53 (Table 4).

The cost of each difference. Table 5 gives the instances in each direction. His move is the band above's most likely move in 51% and 52% of his positions; where it is not, it gives up 3.5 and 3.2 win% on average. Where he plays a pawn break and the band above would not, his move gives up 5.2 and 3.9 win%, 0.30 and 0.28 times a game; where the band above would retreat and he does not, 4.0 and 3.7, 0.73 and 0.86 times a game. Neither is far from his other differences.

	R		Relative cost (win%)		
Kind	First half	Second half	First half	Second half	Both halves
Capture	1.00 (0.96, 1.03)	1.08 (1.05, 1.12)	2.2 (0.3, 4.1)	−0.9 (−2.7, 0.8)	–
Check	1.18 (1.10, 1.26)	1.12 (1.03, 1.22)	−2.0 (−5.0, 1.0)	−1.8 (−4.6, 1.3)	more often, costs no more
Pawn push	1.11 (1.04, 1.18)	0.96 (0.89, 1.04)	0.4 (−1.0, 1.9)	0.0 (−1.2, 1.2)	–
Retreat	0.86 (0.80, 0.92)	0.88 (0.81, 0.95)	0.5 (−1.4, 2.5)	0.5 (−1.6, 2.6)	less often, costs no more
King move	0.91 (0.78, 1.02)	0.96 (0.83, 1.11)	0.2 (−2.0, 2.8)	0.7 (−2.6, 4.8)	–
Queen move	0.99 (0.94, 1.03)	0.98 (0.92, 1.03)	2.0 (0.0, 4.1)	0.2 (−1.7, 2.2)	–
Even trade	1.08 (0.97, 1.20)	1.18 (1.05, 1.32)	−0.8 (−5.5, 4.2)	−3.7 (−6.9, −0.6)	–
Worst piece moves	0.98 (0.92, 1.05)	1.06 (0.98, 1.13)	−0.2 (−2.4, 2.1)	0.2 (−1.3, 1.8)	–
Thins his shelter	1.11 (0.97, 1.28)	1.02 (0.87, 1.18)	2.7 (−0.0, 5.5)	0.9 (−1.0, 2.8)	–
New threat	0.99 (0.95, 1.02)	0.98 (0.94, 1.02)	−0.0 (−1.4, 1.3)	0.3 (−1.0, 1.6)	–
Open file	1.05 (0.98, 1.13)	0.95 (0.86, 1.04)	−1.8 (−3.3, −0.1)	−2.2 (−4.0, −0.5)	–
Battery	1.04 (0.92, 1.18)	0.91 (0.79, 1.06)	0.1 (−2.7, 3.2)	1.3 (−1.3, 4.2)	–
King pressure	0.95 (0.85, 1.08)	1.08 (0.94, 1.25)	−1.6 (−5.0, 1.5)	−0.4 (−4.4, 3.4)	–
Pawn break	1.60 (1.30, 1.97)	1.51 (1.21, 1.94)	1.7 (−0.6, 4.1)	0.7 (−1.1, 2.6)	more often, costs no more
Passed pawn	1.15 (0.97, 1.33)	1.01 (0.84, 1.20)	−0.7 (−5.5, 3.9)	−1.9 (−5.4, 1.3)	–
Outpost	0.75 (0.51, 1.02)	0.65 (0.45, 1.05)	3.6 (−0.5, 8.0)	−0.9 (−3.1, 1.7)	–
Seventh rank	1.16 (0.93, 1.46)	1.23 (0.90, 1.59)	−4.7 (−8.3, −1.8)	0.6 (−4.7, 7.2)	–
Active king	1.01 (0.80, 1.35)	1.00 (0.71, 1.46)	1.0 (−6.1, 11.5)	−3.8 (−6.4, −1.8)	–
Gives the bishop pair	1.04 (0.78, 1.36)	1.11 (0.87, 1.49)	1.0 (−4.4, 7.8)	−1.4 (−6.5, 3.9)	too few ($E = 29.9$)
Weakens his pawns	1.13 (1.02, 1.25)	1.28 (1.16, 1.43)	0.5 (−1.8, 3.0)	0.9 (−1.8, 3.7)	more often, costs no more
Tactic	1.03 (0.97, 1.08)	0.94 (0.89, 1.00)	−2.6 (−5.9, 0.4)	0.2 (−2.1, 2.7)	–
Hangs a piece	0.90 (0.73, 1.09)	0.93 (0.70, 1.20)	13.8 (9.3, 18.6)	14.1 (9.1, 19.4)	–

Table 2: Each kind of move against Maia-2 at the band above. R is his count over the expected count corrected by Maia-2's bias on Lichess, with its 95% interval. The relative cost is the mean win% his instances give up against the band above's most likely move, minus the same over his other differences: for a kind he plays more often on both halves, or with no such reading where the first half's R is at least 1, the positions where he plays it and the band above would not; otherwise the positions where the band above would and he does not. For the control, the direction it tests: he leaves a piece hanging and the band above would not. The last column is what the rule would have read had the controls passed: the kinds whose R lies on one side of 1 on both halves, and their cost. The known fault failed, so none of it is a verdict.

Maia-2's bias. Maia-2 is close to the players at its bands. Where a band had enough moves of a kind, κ lies between 0.83 and 1.27 (Table 6); in 13 of the 154 cells the pooled bias stands in. Averaged over a half, the correction lies between 0.91 and 1.22, so every kind is measurable.

	R against his own band		Maia-2's correction	
Kind	First half	Second half	First half	Second half
Capture	1.02 (0.99, 1.05)	1.06 (1.02, 1.10)	0.99	0.98
Check	1.19 (1.11, 1.27)	1.06 (0.97, 1.15)	1.02	1.00
Pawn push	1.05 (0.98, 1.12)	0.90 (0.82, 0.97)	1.05	1.03
Retreat	0.92 (0.85, 0.99)	0.93 (0.85, 1.02)	0.91	0.91
King move	1.01 (0.86, 1.16)	1.02 (0.88, 1.17)	1.00	1.06
Queen move	1.01 (0.96, 1.06)	1.00 (0.95, 1.06)	0.97	0.97
Even trade	1.16 (1.03, 1.29)	1.13 (1.01, 1.27)	1.01	0.99
Worst piece moves	0.97 (0.90, 1.04)	1.03 (0.95, 1.11)	0.98	0.96
Thins his shelter	1.08 (0.94, 1.24)	0.93 (0.80, 1.09)	1.01	1.00
New threat	0.99 (0.96, 1.03)	0.99 (0.95, 1.04)	1.02	1.02
Open file	1.03 (0.96, 1.11)	0.99 (0.91, 1.08)	1.00	1.02
Battery	1.06 (0.94, 1.22)	0.98 (0.84, 1.14)	0.93	0.95
King pressure	0.90 (0.80, 1.01)	1.11 (0.97, 1.29)	0.95	0.97
Pawn break	1.38 (1.14, 1.67)	1.45 (1.14, 1.86)	0.96	0.97
Passed pawn	1.16 (0.99, 1.35)	1.24 (1.02, 1.51)	0.97	1.18
Outpost	0.79 (0.55, 1.13)	0.82 (0.55, 1.12)	0.99	1.22
Seventh rank	1.13 (0.93, 1.44)	1.15 (0.88, 1.52)	1.01	0.92
Active king	1.16 (0.94, 1.50)	0.85 (0.58, 1.16)	1.17	1.06
Gives the bishop pair	1.07 (0.81, 1.44)	1.13 (0.90, 1.44)	1.08	1.10
Weakens his pawns	1.18 (1.07, 1.30)	1.25 (1.13, 1.38)	0.99	0.96
Tactic	1.05 (0.99, 1.11)	1.01 (0.95, 1.07)	0.99	1.06
Hangs a piece	0.77 (0.63, 0.93)	0.67 (0.52, 0.86)	1.13	0.97

Table 3: Each kind against Maia-2 at his own band, corrected the same way, and the correction itself: the corrected expected count at the band above over Maia-2's own. A correction above 1 means players at those bands play the kind more often than Maia-2 predicts.

Kind	Middlegame	Endgame
Capture	1.05 (1.02, 1.08)	1.00 (0.96, 1.05)
Check	1.18 (1.10, 1.27)	1.12 (1.05, 1.20)
Pawn push	1.00 (0.94, 1.06)	1.13 (1.04, 1.22)
Retreat	0.83 (0.78, 0.89)	0.94 (0.87, 1.02)
King move	0.70 (0.55, 0.86)	1.00 (0.90, 1.10)
Queen move	0.98 (0.94, 1.02)	0.98 (0.93, 1.03)
Even trade	1.15 (1.05, 1.24)	1.02 (0.80, 1.25)
Worst piece moves	1.04 (0.97, 1.12)	1.00 (0.95, 1.06)
Thins his shelter	1.04 (0.92, 1.17)	1.12 (0.97, 1.29)
New threat	0.99 (0.96, 1.02)	0.96 (0.91, 1.01)
Open file	1.01 (0.94, 1.08)	0.98 (0.91, 1.05)
Battery	0.95 (0.85, 1.05)	1.03 (0.89, 1.18)
King pressure	1.07 (0.95, 1.20)	0.96 (0.86, 1.09)
Pawn break	1.56 (1.33, 1.84)	1.53 (1.11, 2.09)
Passed pawn	0.97 (0.83, 1.14)	1.16 (1.01, 1.33)
Outpost	0.74 (0.56, 1.03)	0.58 (0.30, 1.01)
Seventh rank	1.07 (0.81, 1.33)	1.30 (1.04, 1.59)
Active king	–	1.00 (0.84, 1.28)
Gives the bishop pair	1.08 (0.88, 1.35)	1.41
Weakens his pawns	1.21 (1.12, 1.31)	1.15 (1.02, 1.31)

Table 5: The instances of each kind in each direction: how many a game, and their mean D, the win% his move gives up against the band above's most likely move. Over all the positions where his move is not that move, his move gives up 3.5 win% on average in the first half and 3.2 in the second; a kind's reference is those positions less the ones where either move is of the kind.

Kind	1000[a]	1100	1200	1300	1400	1500	1600
Capture	0.96	0.97	1.03	0.99	0.98	0.98	0.99

Table 6: κ, Maia-2's bias at each band on Lichess: the moves of a kind players at the band played over those Maia-2 at the band expected. [a]Maia-2's band below 1100, here from 900. [b]Maia-2's expected count at that band is under 30, so the bias pooled over the bands stands in.

5 Added after the run

These descriptions were added once the rule had been applied; none was named before the run.

	Lichess players at each band							Him	
Kind	1000[a]	1100	1200	1300	1400	1500	1600	First	Second
Pawn break	2.1	1.4	1.9	1.7	1.8	1.8	2.2	2.9	2.7
Retreat	9.3	11.1	9.8	10.2	11.4	11.5	12.2	10.5	12.1
Check	10.4	8.8	9.2	9.3	8.5	7.9	7.8	12.3	10.4
Weakens his pawns	4.7	5.1	5.0	4.7	4.6	4.6	4.1	5.3	5.3
Even trade	3.8	4.8	4.9	5.1	5.4	5.2	5.4	5.0	5.5
Hangs a piece	3.9	2.8	3.0	3.0	2.0	1.9	1.9	2.4	1.8

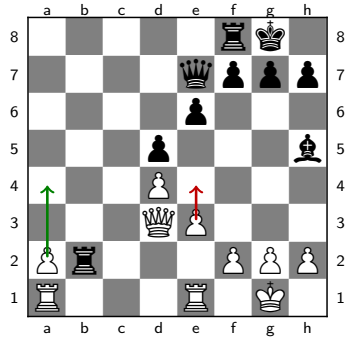

Table 7: Added after the run. The share of positions, in %, in which players play each kind: Lichess players at each band in their own positions, and him in his. The positions differ, so the columns compare the bands with each other, not with him. [a]Maia-2's band below 1100, here from 900.

The bands on Lichess. Among Lichess players (Table 7), retreats rise from 9.3% of positions at 1000 to 12.2% at 1600, and checks fall from 10.4% to 7.8%: both move with rating, the way his differences point. Pawn breaks show no trend, between 1.4% and 2.2% at every band, while he plays one in 2.9% and 2.7% of his positions, where Maia-2 at the band above expects 1.9% and 1.8%. His pawn breaks look like his own way of playing, and his fewer retreats and extra checks like the level he is climbing from.

Whose moves his are. Maia-2 at his own band gives his moves a little more probability than at the band above, on both halves: 0.9% and 2.1% less a move at the band above, both intervals clear of zero. His move is his own band's most likely move 51% and 53% of the time, and the band above's 51% and 52%. He plays like his band, with fewer pieces left hanging.

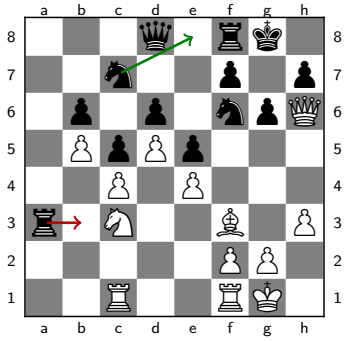

6 Two positions

Two of his positions show a pawn break the band above would not play and a retreat it would (Figure 1). They illustrate; they test nothing.

FEN `5rk1/4qppp/4p3/3p3b/3P4/3QP3/Pr3PPP/R3R1K1 w - - 0 22`

(a) He is White, in the middlegame at 22% to win. He played the pawn break 22. e4 (red), which Maia-2 at 1500 gives 16%; it rates 22. a4 (green) most likely, at 28%. Stockfish: after 22. e4 ♕f6 23. ♕e3 dxe4 he has 21%, after 22. a4 ♕f6 23. ♕f1 ♗g6 24%. D is 3.2, near the median of these instances (3.1).

FEN `3q1rk1/2n2p1p/1p1p1npQ/1PpPp3/2P1P3/r1N2B1P/5PP1/2R2RK1 b - - 2 22`

(b) He is Black, in the middlegame at 54% to win. Maia-2 at 1500 rates the retreat 22…♘ce8 (green) most likely, at 39%; he played 22…♖b3 (red), which it gives 9%. Stockfish: after 22…♖b3 23. ♕e3 ♖a3 24. ♖a1 he has 48%, after 22…♘ce8 23. ♕d2 ♕a8 24. ♕b2 49%. D is 1.2, near the median of these instances (1.2).

Figure 1: His second-half positions. Of the middlegame instances where neither move captures or gives check, the one whose D is nearest the median D of all the second half's instances: left, a pawn break he played and the band above would not; right, a retreat the band above would play and he did not. Each line is the engine's, at 250,000 nodes.

7 What the app can take

- **Nothing yet.** With the known fault failing, no difference here is a habit by the rule, so the coach does not write to any of them.
- **A control he has.** A next round needs a positive control that shows the method finds a difference of the size it reports: a fault he is known to have against stronger players, or a planted one, a player made to play a kind more often by a set factor. Its rule is fixed first.
- **The candidates.** Pawn breaks, the clearest difference on both halves and against his own band, and retreats in the middlegame, the difference that moves with rating on Lichess. Neither costs him more than his other differences here, so either would be his style rather than a fault unless a next round says otherwise.
- **A model of him.** A network trained on his own games, the plan's next step, needs a GPU.

8 Caveats

- **Maia-2 stands in for the players above him.** κ corrects its average bias for each kind of move, measured in Lichess players' positions, not in his.
- **The most likely move stands for what the band above plays** when the cost is measured.
- **The halves are at different ratings.** He climbed through the archive, so a difference that shows in both halves held as he improved; one that shows in only one may have come or gone.
- **A kind of move is a description, not a mistake.** Playing it more often than the band above is a difference; the cost says whether it matters.

- **The app's readings at the pinned commit.** The kinds are the app's readings as the board shows them, without an engine. A piece the reading calls hanging may be defended by a tactic, and a recapture can count as a tactic.
- **Added after the run.** The Lichess rates by band, the likelihood of his moves at each band, the size of the step between bands and the two positions were looked at once the rule had been applied. They describe; a rule built on them needs games this study did not see.
