Do the app's motif labels name the tactic a position holds?

Three of the coaching app's board readers, scored on public puzzles

Chess Coach research lab

Abstract

Three of the app's board readers put a motif word on a position: the theme of the best move the player missed (it files the misses deck, the puzzle buckets and the rule ledger, and the learner credits a solve to the skill it names), the motifs a bad move allowed (counted by the weakness profile, the metrics and the pattern census), and what a move does (the explanations' source). We scored each against the themes Lichess's own tagger put on 4,630 puzzles the app ships and on 20,000 held-out puzzles of the same ratings. All three name forks well. The misses deck's labeller has no word for pins, skewers, discovered attacks, deflections or trapped pieces, and when it says "defensive move" (26% of held-out puzzles) the tagger agrees 0.02 of the time. The review scan tags a hanging piece on 6,334 held-out puzzles, against 813 that the tagger says have one. The move describer is the most precise of the three and the one to build the others on: naming its skewers, discovered attacks and pins before the misses deck's defensive fallback raised agreement on both sets (8.3 and 5.6 points) and is kept.

1 The question

A motif word is a claim about the board. When the misses deck files a position under "defensive move", the learner counts a solve there toward a defensive-move skill; when the review scan tags a hanging piece, the weakness profile counts one more hanging piece. A wrong word sends practice and advice to the wrong place, so before the routines lean on these words we asked how often each is right when it is said (precision) and how often it is said when it is right (recall).

A Lichess puzzle is a mistake, its first move, followed by the line that punishes it, and Lichess tags each with themes. That is the shape the app's readers already read: the position the solver faces, the best move, the mistake that allowed it and the refutation. Lichess's tags come from another heuristic tagger, not from the truth, so this measures agreement; the three puzzles in Section 4 read disagreements on the board.

2 Method

Each reader runs on each puzzle the way the app runs it on a game (commit `d8b771238c`): the theme of the best move on the solver's position and the first solution move (`themeOfBest`); the motifs of the mistake from the position before it, the mistake, the solution line and the score it reaches (`blunderMotifs`); and the findings that are a gain for the solver when the first solution move is described with the rest of the line as its reply (`describeMove`). Both sides' words are mapped to concepts by the app's own vocabulary, so a Lichess theme and an app word name one concept the way the app resolves them. A concept that only one side has a word for is not scored.

The app's pool is the training set for any change tuned here; the held-out set, a seeded uniform sample of the same rating range that leaves out every puzzle the app ships, is the test.

3 Results

The misses deck's labeller. It has six motif words. When none fires it files the position under its phase (34% of the app's pool, 36% held out) or, when one of the solver's pieces was loose and the move protected it, as a defensive move. Puzzles are tactics, so the defensive move mostly catches the tactics the labeller has no word for: said on 864 of the app's pool and 5,166 held-out puzzles, it agrees with the tagger 0.03 and 0.02 of the time. Its hanging piece is right 0.60 and 0.28 of the time. It said back-rank mate on 0 of the app's pool and 12 held-out puzzles, 0 of them tagged so. Its fork is good.

The review scan. It tags a hanging piece whenever the refutation wins material, so it tags one on 1619 puzzles of the app's pool (609 tagged) and 6,334 held out (813 tagged): precision 0.38 and 0.13. It never tags a pin, a skewer, a back-rank mate or a trapped piece. Its fork and discovered attack are precise but catch about half.

The move describer. The most precise of the three on the tactics both vocabularies name: fork, skewer and discovered attack all above 0.6 precision and 0.5 recall on both sets. It finds a quarter of pins (0.24 held out), and its back-rank mate is mostly not one the tagger sees (0.18).

The vocabulary. The app's vocabulary does not resolve the named mates Lichess tags (`pillsburysMate`, `operaMate`, `epauletteMate`, `smotheredMate`, `cornerMate`, `swallowstailMate`, `morphysMate`, `hookMate`, `arabianMate`, `killBoxMate`, `triangleMate`, `anastasiaMate`, `blindSwineMate`, `bodenMate`, `dovetailMate`, `doubleBishopMate`, `vukovicMate`, `balestraMate`; 1,051 tags held out), so they score as nothing on either side.

Table 3: The move describer's gain findings (`describeMove`).

4 Three held-out puzzles

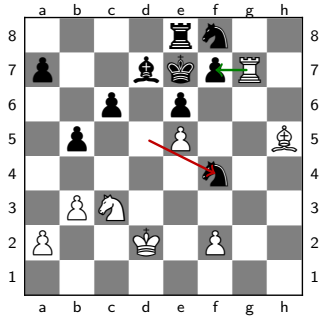

Each board is the position the solver faces; the red arrow is the mistake just played, the green one the first solution move.

Puzzle `0MHcM`, rated 1462

Puzzle `1dno2`, rated 1178

Puzzle `1Aofp`, rated 1168

0MHcM. After 42…♗e3, the solution 43. ♖e1 ♘e5+ 44. fxe5 (`d1e1 f7e5 f4e5`) from `8/5n2/p1K1k3/P7/5P2/4b3/8/3R4 w - - 3 43`. Lichess: `crushing`, `endgame`, `pin`, `short`. The misses deck's labeller: `defensiveMove`. The describer: `trapped-piece`, `pin`, `open-file`.

1dno2. After 41. ♗e3, the solution 41…♖g7+ 42. ♔f6 ♖xc7 (`g8g7 f7f6 g7c7`) from `6rk/2R2K2/1p2p3/4P3/1P6/4B3/6p1/8 b - - 1 41`. Lichess: `crushing`, `endgame`, `short`, `skewer`. The misses deck's labeller: `defensiveMove`. The describer: `skewer`.

1Aofp. After 34...♘xf4, the solution 35. ♖xf7+ ♔d8 36. ♖xf4 (`g7f7 e7d8 f7f4`) from `4rn2/p2bkpR1/2p1p3/1p2P2B/5n2/1PN5/P2K1P2/8 w - - 0 35`. Lichess: `crushing`, `fork`, `middlegame`, `short`. The review scan: `hangingPiece`. The misses deck's labeller: `fork`.

5 A first candidate

The rule for a change, fixed before the first one ran: per puzzle, a reader *agrees* when one of its words names a concept the puzzle is tagged with and *disagrees* when one names a concept it is not tagged with; a change is kept when, on both sets, agreement rises with the 95% interval of the paired difference (2,000 bootstrap draws of puzzles) above zero and disagreement does not rise.

The first candidate changes only the misses deck's labeller: before its defensive fallback, it names a skewer, a discovered attack or a pin when the move describer finds one for the mover. Agreement rose from 40.7% to 49.0% on the app's pool (8.3 points, [7.5, 9.1]) and from 30.3% to 35.9% held out (5.6 points, [5.2, 5.9]); disagreement moved −2.0 points [−2.5, −1.5] and −0.2 points [−0.5, 0.1]. It is kept.

On the player's misses deck the same change re-files 44 positions, and the best line wins material or mates in 20 of them; the describer's pin, on 24 positions, wins material in 8, because it also fires on pins that win nothing at once. A port should carry the skewer and the discovered attack, and the pin only when the line wins with it.

6 What it means for the app

1. Port the kept candidate: the describer's skewer and discovered attack before the defensive fallback, and its pin only when the line wins with it; then make the defensive move require that the move answers a threat the board code can name, the next candidate.
2. The review scan's hanging piece should require a piece that was attacked and not defended before the refutation, not any material the refutation wins; its counts feed the weakness profile and the metrics.
3. The vocabulary should resolve the named mates, so a mate pattern is a concept on both sides.
4. Any change is tuned on the app's pool and kept only if it holds on the held-out set.

7 Limits

Lichess's tags are another tagger's, and a puzzle has as many tags as that tagger found, so a correct app word with no matching tag counts as wrong. Puzzles are tactics by construction; the misses deck is built from the player's own mistakes, where a defensive move is more common, which the drill-decks project measures on the deck itself.
